

4802

SLOPE REDUCER

4802 SLOPE REDUCER

MADE IN ITALY

Material:
ABS with UV protection

Weight:
1,02 kg

Details:
Reinforced inner part, tested one by one

• **Place the reducer along the drinking line (usually in the middle).** For high slopes, maybe that more that one reducer is needed along a single drinking line.

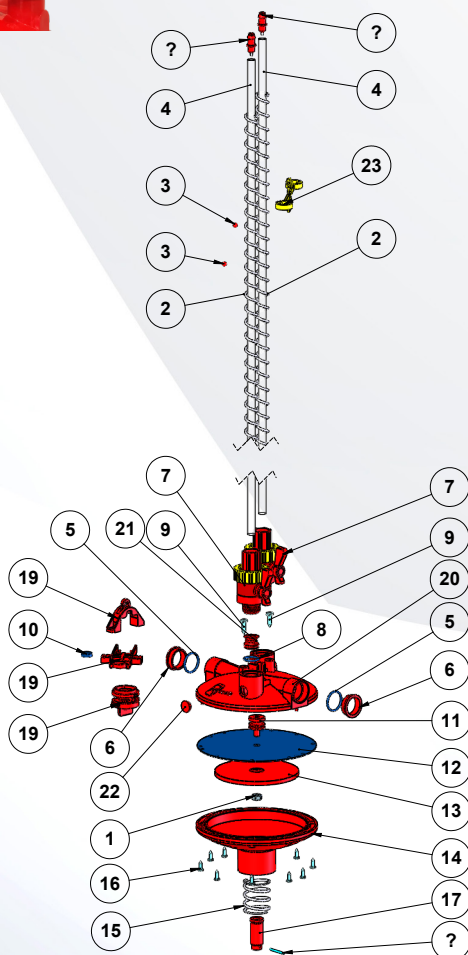

• The first transparent hose shows the water pressure in the middle of the line, where the reducer is positioned. If the water supply regulator has been placed at the beginning of the line, this water level will be higher than the one shown at the beginning of the line.

• By actioning the handle below the slope reducer (the same as for the water supply regulator), you will modify the water pressure starting from the point where the slope reducer is positioned. The water pressure will be modified as shown by the water level in the second transparent hose. After that, you must check the water pressure at the end of the drinking line.

Using our slope reducer 4802, all the negative effects of a slope can be reduced, by making an effective separation in two or more parts of one single drinking line, so that each part is independently adjustable. **We advise to put one slope reducer 4802 in-line each 15 cm of slope.**

To clean the line by flushing, a bypass (art. 4858).
